Week 7: SQL Query Implementation for E-Commerce Database

Scenario and Tasks

The e-commerce database contains customer, product, order, and inventory information. SQL queries are used to retrieve, filter, sort, and summarize these records for routine operations and basic business analysis.

Basic SQL Queries

Definition: Basic SQL queries use SELECT to retrieve the required information from database tables. They can return all columns or only the columns needed for a task.

```
SQL> SELECT * FROM Customer;
